TITLE	:	The Protection of Steel and Zinc-Aluminum Alloys from Underground Corrosion by Painting	
ERIC. PUB.	:	Prace Inst Mech, 7, No 25, 44-60 (1959)	
ABSTRACT	:	Tests have been made on the protective properties under conditions of underground corrosion of coatings of different types of paint (P) on phosphated steel, zinc-plated steel (galvanized or metallized), and on Zn-Al alloys: the results indicate the superiority of synthetic resin based paints over oil-based paints. The following enamels were found to be most effective: Z-S-101-A epoxy enamel (oven-dried), 2062 F gray enamel, and chlorinated rubber-based enamel. The prepara-

ABSTRACT : tion of the metal surface prior to the application of the P has a marked effect on the corrosion protective properties of the P. Best results are obtained from the application of layer of galvanic Zn followed by passivation or phosphating. For best results in the corrosion protection of Zn-Al alloys, a preliminary pickling is recommended followed by the application of one coat of Z-S-101 A or 2062 F gray enamel. Acid peat soils have the most aggressive effect on P coatings.

TITLE: Some Application Possibilities of Dynamics With Varying Mass

PERIODICAL: Przegląd Mechaniczny, 1960, No. 12, pp. 348 - 351

TEXT: Kinetic problems of varying masses is one of the mechanical sections not receiving enough attention in the present-day education system. The author lists a number of scientists who contributed towards expansion of dynamics with varying mass, i.e., I.V. Meshcherskiy (Ref. 1), Cayley (Ref. 2), Bushley (Ref. 3), Pollard (Ref. 4), Levi-Civita (Ref. 5) and Konstantin Tsiolkovskiy 1857 - 1935. Further, he presents the basic theory of this problem and describes a number of examples. There are 4 figures and 7 references: 2 Polish, 2 Soviet, 1 French, 1 Italian and 1 English.

Title : Volatile Corrosion Inhibitors

Orig Pub : Opakowanis, 1957, 3, No 4, 2-5

Abstract : Compositions are given of the industrially utilized volatile corrosion inhibitors (VCI), and it is pointed out that most of them are different amine- compounds. Processes of VCI adsorption at metal surface are considered in presence and in absence of hydrolysis of VCI. Investigations of effectiveness of VCI during warehouse storage of metal articles and in their shipping, which are conducted at the Polish Institute of Precision Mechanics, are described. Determinations were also made of appropriateness of the use of VCI with parkerized,

oxidized and colored steel, Cu, brass, Zn and passivated Zn. For comparison, German and British preparations were also tested. It was found that Polish VCI are of same quality as German and British. It is noted that effectiveness of VCI depends on their purity and production method. Highest effectiveness is exhibited by C.P. dicyclohexylamine nitrate, carbonate of cyclohexylamine, and also its salts with organic acids. After 120-hour tests of VCI (100% relative humidity, 55°) no corrosion was observed in samples kept in the atmosphere, while in absence of VCI an 0.3 mm deep corrosion was found (corrosion started after 30 minutes). Such effectiveness of VCI is possible only when their concentration in the atmosphere is sufficiently high. Fields of application of VCI are enumerated. Data on expenditure, costs and packaging methods, are cited.

It is noted that such VCI as dicylohexylamine nitrate and salts of fatty acids are not suited for use with colored articles. Recommendations are made concerning packaging: electric and precision equipment is protected over the VCI-impregnated paper with paper-tape wrapping, against mechanical damage, and then with paraffin-paper; phonograph- and sewing needles, dental drills, hair curling irons, etc., are packed in boxes wrapped with VCI-impregnated paper; rolls of wire and surface of pipes are protected by tape wrappers made from the same paper; for protection of the inner surface of pipes paper coils impregnated with VCI are placed inside of them.

from Corrosion.

Orig Pub: Opakowanie, 1958, 4, No 4, 10-11.

Abstract: The influence of various corrosion factors on
the properties of Sn are examined. It is noted
that the danger of electrochemical corrosion of
tin plates decreases considerably in the pres-
ence of organic (oxalic, citric, etc.) acids,
which form complexes with Sn ions. In the stor-
ing of canned goods, the use of a corrosion in-
hibitor is recommended. -- V. Kashcheyev.

TITLE : Corrosion and Corrosion Protection of Metal Food
Cans

ORIG. PUB. : Opakowanie, 1958, 4, No 6, 13-14

ABSTRACT : Food cans (C) made of untinned iron are covered with several layers of thermoplastic phenol-formaldehyde resin lacquer. In cans of the above type vitamin "C" is better preserved than in glass jars. It is to be noted that in the manufacture of food C, Al and its alloys find an ever increasing application. Pure Al stands well against corrosion, but it is not as mechanically strong as its alloys. It is proposed to manufacture C from "back" iron, plated with Al, which in its turn, is covered with lacquer made of epoxide or

TITLE:

The Gyroscopic Moment of Elastic Shafts Whirling at High
Speeds and Its Influence on the Mechanical Vibrations
of the System

PERIODICAL: Przeglad mechaniczny, 1959, Nr. 13, pp 424-428. (Poland)

ABSTRACT: This is a continuation of two previous articles on the subject (1, 7 and 8), hence the author nowhere defines the terms and symbols used in deriving the mathematical formulae involved. The article begins with a brief discussion of the influence of the gyroscopic moment on the change of the critical number of revolutions of a shaft and shield system. Fig 8 shows three phases of an experiment carried out during the author's visit to the Mechanics Institute of the Technische Hochschule in Dresden. The author then gives a brief theoretical description of the experiment. Basing himself on a generalized form of Hooke's Law (Equation 7), the author shows how to calculate the linear and angular displacement of the shield. He then derives

Card 1/2

POL/35-59-13-3/25

The Gyroscopic Moment of Elastic Shafts Whirling at High Speeds and
Its Influence on the Mechanical Vibrations of the System

several formulae showing the values of positive and negative precession. These are summarized in a graph (Fig 12). The author then describes the influence of the gyroscopic moment on the vibrations of a rigid shaft rotating on resilient bearings. He considers that both types of problems can in fact be treated similarly since the elastic parts of the shaft between the shield and the bearings can be considered as elastic supports with reduced rigidity. There are 12 graphs, 8 photographs and 9 references, 3 of which are Polish, 1 German and 5 Soviet.

Equation of the decomposition of zinc carbosilicate. M. J. Zawadski and W. Szemethi. Bull. Soc. Fr. Min., Anal., Crist., 1940-1946, 37:31 (1946) (in English); cf. C.A. 38, 6139. - X-ray, on the decompos. in vacuum of $ZnCO_3$ into ZnO and CO_2 were reported. A thermoluminescence was used to follow the course of the reaction at temps. of 400°, 450°, and 440°. Between 400° and 420° a noticeable speeding-up of decompos. and the appearance of 2 velocity max. were observed. Similar effects were absent at 440°. ZnO bound on the surface a part of the CO_2 from the decompos. of $ZnCO_3$, and the velocity of this tendency increased with increasing temp. At 440° this tendency predominated; at lower temp. it did not. Decompos. was not complete in any of the expts., and never exceeded 81%. X-ray analysis indicated no $ZnCO_3$ above 60% decompos., but only ZnO and adsorbed CO_2 . Below 60% decompos. $ZnCO_3$ was present. The crystal lattice of ZnO , however, developed slowly below 400° and in a slower process than the production of CO_2 . For these reasons $ZnCO_3$ cannot be obtained from ZnO and CO_2 ; neither can equil. be obtained by decompos. of $ZnCO_3$. The effect of temp. on the velocity is, therefore, important, and activation heat (16,400 cal./mole) is greater than reaction heat (16,400-17,200 cal.). R. B. Umiker

Abstract: [Authors' Russian summary modified] Authors report a case with clinical and p.m. findings consistent with Takayasu's syndrome. However, 23-year old history of vascular disease commencing with characteristic symptoms of Buerger's disease and quantitative rather than qualitative differences in changes occurring in all main arteries suggest to the authors that both these diseases may have one etiological factor. Of the six references, one is Polish, one Hungarian, and four Western.

AUTHORS: Droste, Z. and Zawicki, I.

TITLE: New seismological apparatus

PERIODICAL: Przegląd geofizyczny, no. 4, 1961, 291-292

TEXT: The extended program of seismic studies in Upper Silesia has necessitated the development of special apparatus for measuring the tilt and stresses of the earth's crust. The apparatus was designed and built by I. Zawicki and consists of a tiltmeter and a tensograph. In both cases use is made of the Hall effect. The Hall element is located in a non-uniform magnetic field and any change in its position produces a change in the Hall emf. The two devices have been installed in a mine shaft at a depth of 321 m. ✓

AUTHORS: Nalecz, Maciej and Zawicki, Ignacy

TITLE: Application of the Hall effect to seismographic recording

PERIODICAL: Acta geophysical polonica, v. 10, no. 1, 13-24

TEXT: It is shown that by placing a Hall plate in a nonuniform magnetic field it is possible to obtain a Hall emf which is proportional to the displacement of the plate in a given direction. The region of proportionality is limited, but sufficient for practical purposes. The magnet employed by the authors is illustrated schematically in Fig. 2. In this field configuration, the Hall emf is approximately given by Eq. 2.

$$U_H = \frac{R_H}{b \cdot d} \cdot I_p \cdot B \cdot X \cdot 10^{-8} \quad \text{where } d \text{ is the}$$

thickness of the plate, b its breadth, I_p - the current flowing through it, B - the magnetic flux density, R_H - Hall's constant, and X - displacement. In an actual seismograph, the plate is attached to the end of a

Card 1/3

D218/D304

Application of the Hall ...

long rod of a suitable moment of inertia which is spring-loaded at one end and can rotate about an axis attached to a heavy base. The Hall emf is recorded by a moving-coil galvanometer, whose response can be traced out on photographic paper: Polish CH1 Hall plates were employed ($12 \times 6 \times 0.25 \text{ mm}^3$; Ge; $R_H = 2500 \text{ cm}^3/\text{coulomb}$). The equations of motion of the system have been solved and the results are reported and compared with those for the electrodynamic seismograph. The Hall-plate seismograph gives a higher magnification (by a factor of up to 100) and falls off more slowly with frequency. It is shown that the combination of a Hall date and a non-uniform magnetic field can be used to measure any quantity which has a linear displacement associated with it. The authors have constructed a strain gauge and an inclinometer based on this principle. Professor Stefan Manczarski, Director of the Zaklad geofizyki PAN (Geophysics Institute PAS) and Docent Doctor Roman Teisseyre are thanked for their interest and advice. There are 12 figures and 3 references: 1 Soviet-bloc and 2 non-Soviet-bloc. The references to the English-language publications read as follows: M. Natecz, Electronic Technology, Jan. 1961; J.L. Bower,
